No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 32,

Bioactive metal RNA polypeptide - useful for modulating angiogenesis, etc.

Claim 1; Page 15; 16pp; German.

A novel bioactive metal RNA polypeptide (RNP) has a RNA component including the sequence AAT62568 and a polypeptide component having the sequence AAM01826, which is encoded by AAT62569. The RNP, or anti-RNP immunoglobulins, can be used to modulate and/or analyse angiogenesis and the vascular state of mammalian tissue, transfer genetic information in cells and selectively alter the nucleic acid content of cells. Leukocytes from pig's blood were cultured in medium, and the supernatant treated with NH4 sulphate at 13, 45 and 90% saturation to precipitate protein fractions. The residual supernatant was diltued to 45% NH4 sulphate saturation and concentrated by ultrafiltration using a 0.5 kD membrane.

The retenate was purified to give 8 mg of product described as monocyto-

This invention describes novel copper-containing ribonucleoproteins which are ternary complexes of an $100 protein, copper ions, and RNA comprising the following consensus sequence or its complement GGAAAANNNUNAUAGUAI-COUNNUUNNUNNUNNUNAUAGUAI-COUNNUUNNUUNNUNNUNNAUAAGUAI-COUNGANO-13AGAA-AUNO-16UUAGCAG where N = G, A, U or C. The ribonucleoproteins are stated to have the following properties (1) cell-selective morphogenic action in vitro on isolated primary and/or cloned blood capillary endothelial cells in culture for the non-mitogenic induction of the change in cell phenotype from the confluent state, for non-mitogenic alteration of the spatiotemporal supracellular organisation of tells into three-dimensional organoid, capillary-like structures in culture, (2) a specific chemotropic action on blood vessels in vivo, (3) induction of directional growth of blood cussels in vivo and (4) induction of neovascularisation of tissues through directed ingrowth of blood vessels. Their use for modulating angiogenesis is claimed
                                                                                                                                0
                                                                                                                                                                                                  1 TKLEDHLEGIINIFHQYSVRLGHYDTLIKRELKQLITKELPNTLKNTKDQGTIDKIFQNL 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents the CAAFI calcium-binding protein isolated from bovine amnictic fluid. CAAFI belongs to the S100 protein family, which includes calcyclin, MRP8, and MRP4. Intracellular calcium ion concentration is one of the key factors for intracellular signal transduction. The calcium signals are transduced by various calcium-binding proteins, such as the protein encoded by this sequence. CAAFI is normally expressed in squamous epithelial cells, neutrophils and macrophages, but atypical epithelial cells are negative for CAAFI and overexpression is observed in several types of cancer cells and neutrophils/macrophages infiltrating cancercous lesions. Detection of CAAFI (using antibodies in usual immunoassays) can be used to diagnose (or monitor) inflammation, neoplasia (particularly squamous cell).
                                                                  09

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Bovine, EN-RAGE, extracellular novel RAGE binding protein, receptor for advanced glycation endproduct, inflammation; inhibition, antiinflammatory, immunoglobulin, cell surface molecule, septic shock, systemic lupus erythematosus; inflammatory lupus nephritis; endotoxaemia; autoimmune disorder; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New human EN-RAGE (extracellular novel receptor for advanced glycation end products) peptide, useful for identifying anti-inflammatory compounds that inhibit its interaction with RAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes an isolated human EN-RAGE (extracellular novel receptor for advanced glycation end products) peptide (P1). The EN-RAGE peptide binds to RAGE which is a member of the immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   superfamily of cell-surface molecules. A compound capable of inhibiting the interaction of EN-RAGE with RAGE is useful for the suppression of inflammation resulting from systemic lupus erythematosus, inflammatory lupus nephritis, septic shock, endotoxaemia, or an autoimmune or inflammatory disorder in which the recruitment of EN-RAGE containing inflammatory cells occurs. The compound is also useful for the treatment of systemic lupus erythematosus, inflammatory lupus nephritis in a subject. The human EN-RAGE peptide is useful for identifying compounds that inhibit its interaction with RAGE. The present sequence represents the bowine CAAPI which shows homology to the human EN-RAGE N-terminal amino acid sequence

Bovine; EN-RAGE; extracellular novel RAGE binding protein; receptor for advanced glycation endproduct; inflammation; inhibition; antiinflammatory; immunoglobulin; cell surface molecule; septic shock; systemic lupus erythematosus; inflammatory lupus nephritis; endotoxaemia; autoimmune disorder; inflammatory disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New human EN-RAGE (extracellular novel receptor for advanced glycation end products) peptide, useful for identifying anti-inflammatory compounds that inhibit its interaction with RAGE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       novel receptor for advanced glycation and products) peptide (PI). The EN-RAGE peptide binds to RAGE which is a member of the immunoglobulin superfamily of cell-surface molecules. A compound capable of inhibiting the interaction of EN-RAGE with RAGE is useful for the suppression of inflammation resulting from systemic lupus erythematosus, inflammatory lupus nephritis, septic shock, endotoxaemia, or an autoimmune or inflammatory cells occurs. The compound is also useful for the treatment of systemic lupus erythematosus, inflammatory lupus nephritis in a subject. The human EN-RAGE peptide is useful for identifying compounds that inhibit its interaction which RAGE. The present sequence represents the bovine corneal antigen which shows homology to the human EN-RAGE pe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TKLEDHLEGIINIFHQYSVRLGHYDTLIKRELKQLITKELPNTLKNTKDQGTIDKIFQNL 60

Calcium binding protein CAAF1.

01-MAY-1997

Calcium binding protein; human; amniotic fluid; \$100 protein family; intracellular signal transduction; squamous epithelial cell; neutrophil; macrophage; cancer; cancerous lesion; inflammation; neoplasia; cervix; squamous cell carcinoma; skin; oesophagus; CAAFI; lung; blood disease.

```
The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein tamilies. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polymucleotides and polypeptides are used for diagnosis, proposis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   gene therapy (expression of sense or antisense sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                    Human, perlecan, retinol-binding plasma protein, calgranulin B; vaccine, ganglioside GM2 activator, saposin B; degenerative disease, glial cell; neurological disease, auto-immune disease, multiple sclerosis; toxicity, Alzheimer's disease, Parkinson's disease; amyotrophic lateral sclerosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Detecting, preventing and treating degenerative, neurological and autoimmune diseases, particularly multiple sclerosis, using specified polypeptides or related nucleic acid or ligand.
                                                                                                                                                                                                                                                                                                                                                                rheumatoid polyarthritis; lupus erythematosus; gene therapy.

human amnictic ffuid. CAARI belongs to the S100 profein family, which includes calcyclin, MRR8, and MRP94. Intracellular calcium ion concentration is one of the key factors for intracellular signal transduction. The calcium signals are transduced by various calciumbinding proteins, such as this protein. CAARI is normally expressed in squamous epithelial cells, neutrophils and macrophages, but atypical epithelial cells are negative for CAARI and overexpression is observed in several types of cancer cells and neutrophils/macrophages infiltrating

This sequence represents the CAAF1 calcium-binding protein isolated

Claim 1; Page 24; 36pp; English.

cancerous lesions. Detection of CAAFI (using antibodies in usual immunoassays) can be used to diagnose (or monitor) inflammation, neoplasia (particularly squamous cell carcinoma of the skin, oesophagus,

ung and cervix), and skin and blood diseases

neoplasia

New human or bovine calcium binding protein and related nucleic acid - is a marker for inflammation, neoplasia, skin and blood diseases.

This is a human chemotactic cytckine I polypeptide. The encoding polymucleotide, along with a vector and a host cell can be used for the recombinant production of the chemotactic cytokine. Cytckine agonists and antagonists can be used for the treatment of a patient requiring a chemotactic cytokine I and for the treatment of a patient requiring the inhibition of a chemotactic cytokine I polypeptide, respectively. The chemotactic cytokine is used to treat tumours, chronic infection, leukaemia and T-cell mediated autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   S100 protein; human; treatment; cardiomyopathy; cardiac insufficiency; calcium-binding protein; calcium homeostasis; cardiac muscle; pumping capacity; myocardial cell; systolic calcium ion release; sarcoplasmic reticulum; cardiac disease; hypertension; rhythm disorder;

This invention describes a novel composition for treating primary or secondary cardiomyopathy or cardiac insufficiency contains at least one Sloo protein (I) or mucleic acid (II) encoding (I), or their mutents or fragments, or a gene transfer vector containing (II), optionally containing in a gene transfer vector containing (II), optionally contains involved in calcium homeostasis, so their overexpression in cardiac muscle will improve pumping capacity (and overall capacity) of the heart. In cultured myocardial cells they increase the contraction and cardiac muscle will improve pumping capacity (and overall capacity) of the heart. In cultured myocardial cells they increase the contraction and cell and the sarcoplasmic reticulum (SR) and calcium re-uptake by SR. (I) are used to treat cardiomyopathy (CMP) where inherited or caused by contained and ischemic CMP caused by arteriosclerosis, calculum disorders and ischemic CMP caused by arteriosclerosis, calculum disorders or valve defects, generally any condition associated with reduced contractile force. Unlike calmedulin, which is expressed the underlying defect in the sarcoplasmic reticulum (SR) that causes cardiac Human; perlecan; retinol-binding plasma protein; calgranulin B; vaccine; ganglioside GMZ activator; saposin B; degenerative disease; glial cell; neurological disease; auto-immune disease; multiple solerosis; toxicity; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; rheumatoid polyarthritis; lupus erythematosus; gene therapy. 1 TKLEDHLEGIINIFHQYSVRLGHYDTLIKRELKQLITKELPNTLKNTKDQGTIDKIPQNL TKLBEHLEGIVNI FHQYSVRKGHFDTLSKGELKQLLTKELANTIKNIKDKAVIDBIFQGL Composition containing 8100 protein, corresponding nucleic acid or vector, useful for treating cardiomyopathy and cardiac insufficiency. 0; Gaps Length 92; Indels th 71.1%; Score 332; DB 3; L Similarity 70.3%; Pred. The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GMZ activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in

Claim 1; Page 166-167; 209pp; French.

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polyucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GM2 activator, calgranulin B or saposin B protein families. The method is used for detecting, preventing or treating a degenerative, meurological and/or auto-immune disease. The polymucleotides and polypeptides are used for diagnosis, prognosis, provention and treatment of multiple solerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and Parkinson's diseases, amyotrophic lateral solerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisease sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells

Diagnosing, treating or preventing inflammatory diseases comprises determining the amount and/or concentration of CALGRANULIN C polypeptide and/or nucleic acids encoding the polypeptide present in a biological

Claim 7; Page 64; 64pp; English.

The present invention describes a method for diagnosing inflammatory diseases, which comprises determining the amount and/or concentration of calgarantin C polypeptide and/or nucleic acids encoding the polypeptide present in the biological sample. Also described are methods for treating or preventing an inflammatory disease in a mammal, and medical treatment of the mammal, where the treatment is based on the stage of the disease to be treated or prevented. Calgranulin C has antiinflammatory activity and can be used in gene therapy. The method is useful for diagnosing, treating or preventing inflammatory diseases, e.g. vasculitis (particularly Rawasaki disease), cystic fibrosis, chronic inflammatory diseases like ulcerative colitis or crohn's disease, chronic bronchitis, inflammatory arthritis (e.g. psoriati arthritis, rheumatoid arthritis or seronegative arthritis), systemic onset juvenile rheumatoid arthritis or seronegative arthritis), systemic onset juvenile rheumatoid arthritis or chronic inflammation, an acquired infection on the background of a inflammatory disease, or an exacerbation of an already present disease.

The method is also useful for diagnosing specific stages of inflammatory diseases, for determining the risk of relapse, and for discriminating the risk of relapse, and for discriminating charactive inflamman cagaranulin C, which is used in the exemplification of the present

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRE) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this specified not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess Claim 20; SEQ ID NO 57941; 103pp; English Liu C, 2001-639362/73 N-PSDB; AAS91769 biodiversity. useful in of mutations

Increasing life-span of mammalian haemato-lymphoid cells by transforming stem cells - with construct contg. cell-specific transcription initiator and gene encoding protein that increases lifetime, useful for drug screening and treatment.

Example 1; Col 33-34; 34pp; English.

Gene, the herpes virus thymidine kinase gene or an oncogene. Haematclymphoid cells are especially neutrophils and the construct doubles the lifespan of transgenic cells. Transgenic cells or transgenic animals produced are used for screening for substances and treatments that prevent or promote cell death. They can also be returned to the patient to modulate apoptosis, i.e. in the treatment of disorders related to abnormal cell proliferation or death. Typical applications are treatment of viral diseases, including HIV; cancer and cystic fibrosis AAW17062 is the human MRP14 protein. The transcriptional initiator of the MRP8 gene was used in a construct for expressing an open reading frame that increase the lifespan of a mammalian haematolymphoid cell, e.g. the mammalian bcl-2 gene, a CFTR (cystic fibrosis transmembrane regulator)

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 20,

Sequence 2, Application US/09826589

Batent No. 6670136

Patent No. 6670136

APPLICANT: Schmidt, Ann Marie

APPLICANT: Schmidt, Ann Marie

APPLICANT: Stern, David

APPLICANT: Stern, David

TITLE OF INVENTION: EXTRACELLULAR NOVEL RAGE BINDING PROTEIN (EN-RAGE) AND USES THER)

FILE REFERENCE: 0575/58673-B-PCT-US

CURRENT APPLICATION NUMBER: US/09/826,589

CURRENT FILING DATE: 2001-04-05

NUMBER OF SEQ ID NOS: 6

SOFTWARE: PatentIn version 3.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20
